

TERKO SATIN

Terko Satin is manufactured from polyester/cotton cospun yarns. Each yarn is produced by spinning a sheath of cotton around a core of continuous filament polyester. The result is a thread with the sewing characteristics of a top quality cotton yet retaining the many advantages of synthetic threads.

Terko Satin is polished to provide an extremely smooth surface. Its stretch and recovery properties make it indispensable in stretch seams. Terko Satin combats needle heat in sewing and is an excellent multi-purpose industrial thread.

BONDED POLYESTER

Bonded Polyester is a continuous filament polyester sewing thread with a bonded finish. The special bonded finish is applied to the thread to ensure that the filaments and plies of the thread remain securely bonded together even in zig-zag and multi-directional stitching.

Bonded Polyester has a high tensile strength and good resistance to acids. It is completely rot proof and highly resistant to seawater and ultra-violet light therefore it makes an excellent choice for all marine work..
